# Leveraging LTI and CASA to expand the value of your LMS Environment

Given by: Hap Aziz (IMS Global),

Rose Rocchio (UCLA)

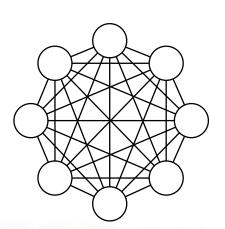

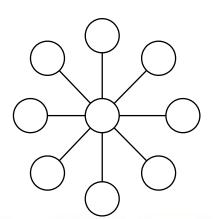

#### **Evolution of LTI App Sharing**

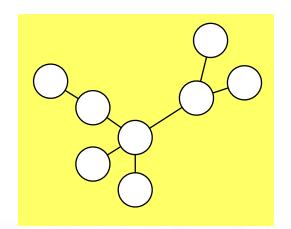

Inefficient Integration

Authoritative Integration

Peer to Peer App Ecosystem

# What can CASA do?

- Publish, share & connect
- Curate & filter the network

#### Why is CASA Useful?

- Provides Discovery and local ratings of apps
- Curation of Apps with regard to our own
  - Policys:
    - Mobile Friendly
    - Ads
    - Privacy
    - Accessibility
    - Standards

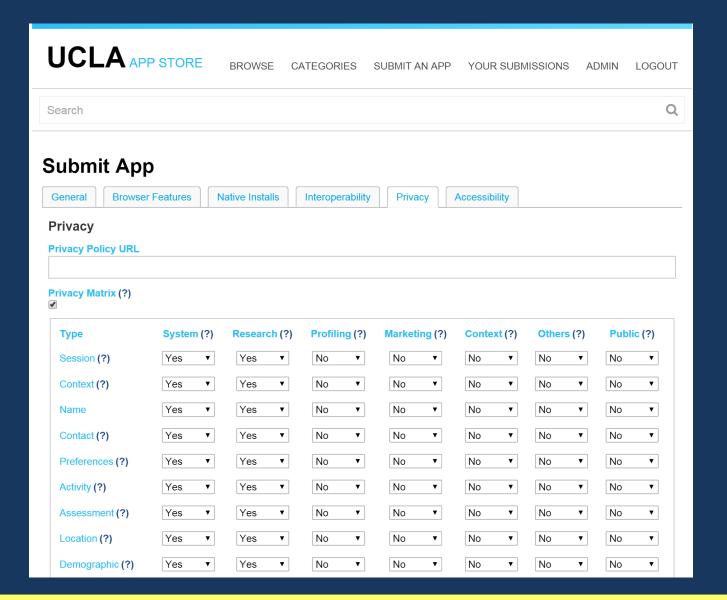

# How does this work?

Where does all the meta data come from?

# App Meta Data & Policies

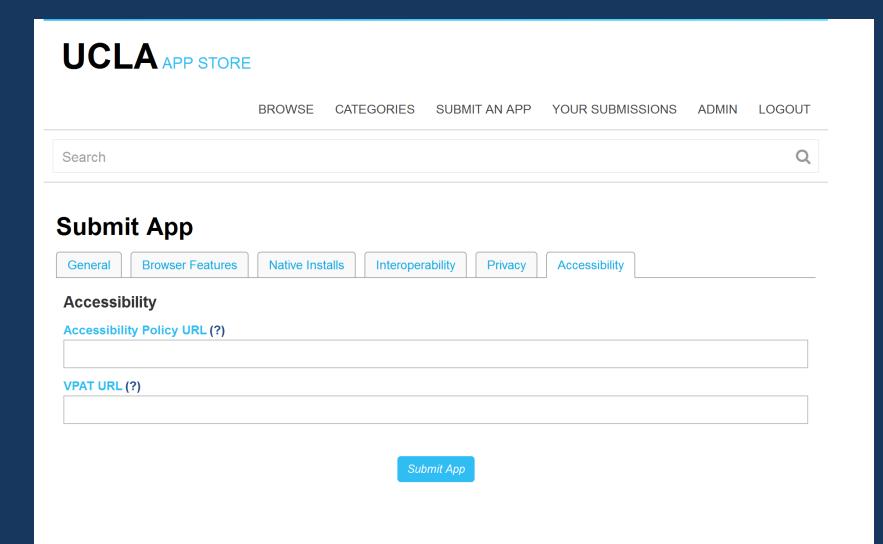

#### Filter based on Privacy...

# Filter on Interoperability

te	roperability
LTI	
	Global's Learning Tools Interoperability (LTI) standard allows for interoperability between applications and consumers such as learning management systems. These properties allow the ap The to push an app back to a learning management system with all the information necessary to set up the app as an LTI tool.

ocheme					
Action					

# What else can CASA do?

- Discover, review & rate
- Collect, analyze & explore

## App Discovery in an LMS

# Use Case:

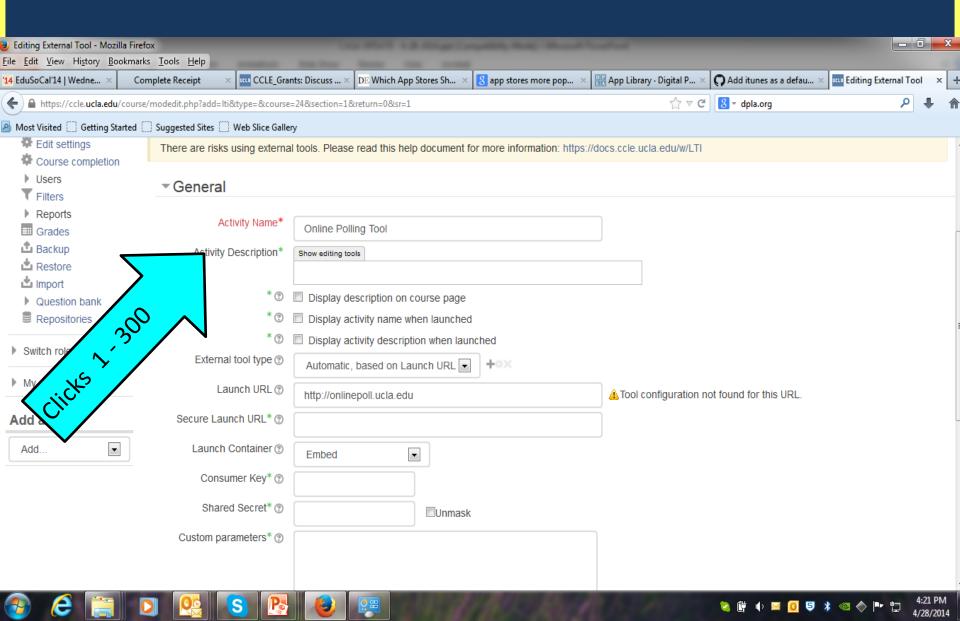

Connecting to a new LTI app in Moodle Today...
takes about 300 clicks

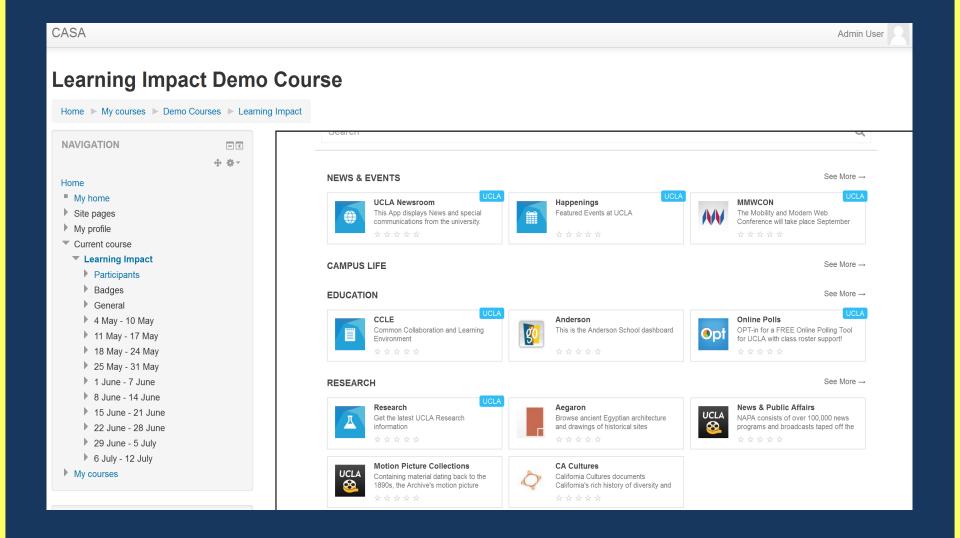

# The problem:

Instructors, do not have a good mechanism to discover, find and review ratings of LTI enabled tools so that they can quickly and expediently figure out which ones will enhance their courses.

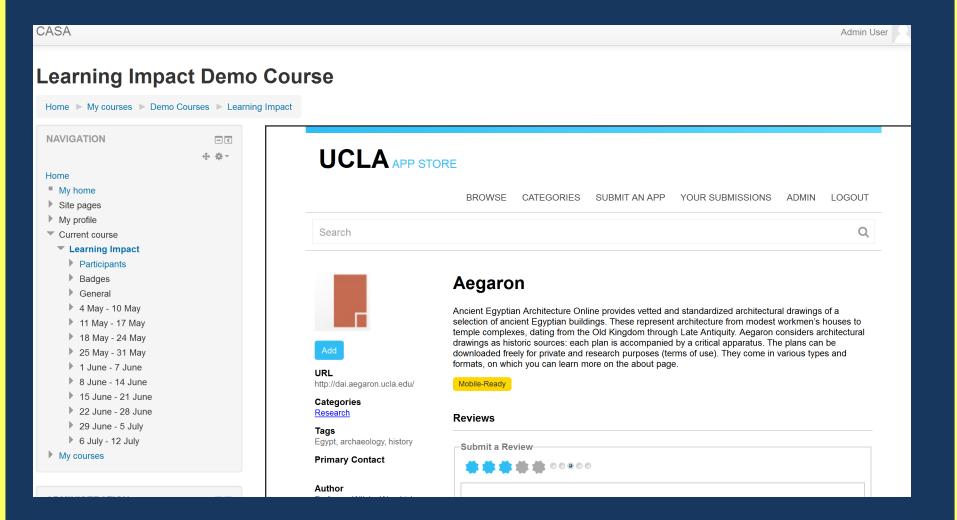

## Adding External Tools w/o CASA

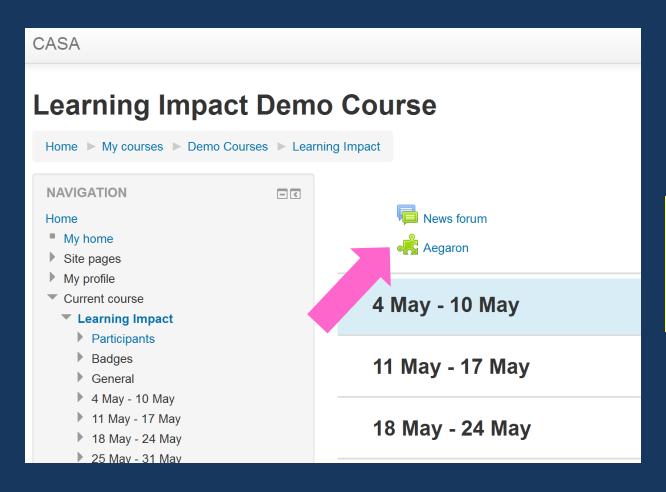

#### LTI App store inside Moodle

#### Review App & Add it

#### **Tool Added into Course**

#### Great, Lots of new tools, but...

- The institution has no idea...
  - Which content is being added to which courses
  - How content is being used
- The publisher has no idea...
  - How their content is propagating through the network
  - If and why their content is being rejected by other nodes
  - How effectively users are finding their content

#### Content Discovery Metric Profile

- Create sensors that report on...
  - How apps spread through the network
  - How apps are found and viewed
  - When apps are added to storefronts and courses
- Actors mirror CASA modules, but not CASAspecific
- Events (or some of them) could be applied to other stores, even if they don't have peering functionality

# Events Captured by CASA Caliper Sensors CASA Centric Environment Sensors

- nodeShared (publisher)
- nodeRejected (receiver)
- nodeAccepted (receiver)

#### LMS Embedded Environmental Sensors

- userFound (storefront)
- userViewed (storefront)
- userAdded (consumer)

#### 3 Demos

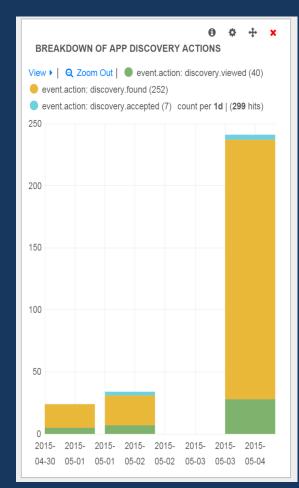

#### CASA-Caliper Sensor Visualization

#### What's Next for CASA?

- Caliper Attribute
  - This will allow filtering of tools that provide DATA back to the institution
- Potential to add more LTI 2.0 details
- Competency attribute (s)

# Discussion – How do we share this message about CASA?

- How do we get the awareness we need?
- Ideas?
- Thoughts?
- Brainstorm?

# How to get involved:

- Join the IMS Global CASA Taskforce
- Launch your own CASA App Store
- Or make your existing App Store speak CASA
- Join biweekly meeting discussions
- Develop attribute schemas
- Share how you implement CASA
